

Websocket Client and Server Program - CNT4007C Spring '17 PA1

Sergio Puleri

UFID: 2196-3931

spuleri@ufl.edu

Compilation (Server) in a Unix Environment

```
cd server && javac *.java
```

Compilation (Client) in a Unix Environment

```
cd client && javac *.java
```

Run Server

```
java server <port number>
```

Ex: `java server 8080`

Run Client

```
java Client <host name> <port number>
```

Ex: `java client localhost 8080`

Running on UF CISE machines:

- Transfer zip file of source code to machine by your method of choice
- Follow above instructions to compile and run server and client

Code Structure

There are two directories:

- `/websocket/server/` holds the server program related files
 - `Server.java` is the main driver class for the Server. It creates a new server and begins listening on the desired port.
 - `ServerLogic.java` maintains all of the logic for the server such as:
 - beginning to accept connections
 - initiating communication with a client once a connection is made
 - Processing client messages and computing results
 - Handling errors in client messages
 - Responding accordingly
 - Terminating connections and and listening for new connections
 - `Response.java` is a wrapper class to handle responses to client. This is used to handle different error responses as well as to maintain the result of the computation and to return the appropriate String back to the client.
- `/websocket/client` holds the client program related file.
 - `Client.java` is the only file and class as the client's

responsibilities are quite simple:

- All functionality is handled in the main function
- First the client attempts to make a connection to the websocket at the provided hostname and port number
- If successfully, it opens an out and input stream buffer to communicate with the server
- Upon receiving the first message from the server, the user of the program is prompted to enter a message from `stdin`
- This message is sent directly to the server as it was typed in by the user
- A response is waiting for and we print the response and allow the user to input another command on loop
- If the server ever responds with "-5" we exit and terminate the process.

Example Outputs

```
2. sergiopuleri@mbp: ~/Dropbox/Spring '17/CNT4007C/websocket/server (zsh)
sergiopuleri@mbp ~/Dropbox/Spring '17/CNT4007C/websocket/server javac ../*.java
sergiopuleri@mbp ~/Dropbox/Spring '17/CNT4007C/websocket/server java server 8080
Listening on port 8080
get connection from ... (/127.0.0.1:62629)
get: add 4 2, return: 6
get: add 4 2 20, return: 26
get: subtract 50 22 10, return: 18
get: multiply 4 4 4, return: 64
get: mu, return: -1
get: multiply 1, return: -2
get: multiply 1 2 3 4 5 6 7, return: -3
get: add 9 e r, Parsing failed, invalid input: e
java.lang.NumberFormatException: For input string: "e"return: -4
get: bye, return: -5
get connection from ... (/127.0.0.1:62690)
get: add 6 7, return: 13
get: subtract 99 97, return: 2
get: terminate, return: -5

1. sergiopuleri@mbp: ~/Dropbox/Spring '17/CNT4007C/websocket/client (zsh)
sergiopuleri@mbp ~/Dropbox/Spring '17/CNT4007C/websocket/client javac ../*.java
sergiopuleri@mbp ~/Dropbox/Spring '17/CNT4007C/websocket/client java client localhost 8080
receive: Hello!
add 4 2
receive: 6
add 4 2 20
receive: 26
subtract 50 22 10
receive: 18
multiply 4 4 4
receive: 64
mu
receive: incorrect operation command
multiply 1
receive: number of inputs is less than two
multiply 1 2 3 4 5 6 7
receive: number of inputs is more than four
add 9 e r
receive: one or more of the inputs contain(s) non-number(s)
bye
receive: exit
✖ sergiopuleri@mbp ~/Dropbox/Spring '17/CNT4007C/websocket/client java client localhost 8080
receive: Hello!
add 6 7
receive: 13
subtract 99 97
receive: 2
terminate
receive: exit
✖ sergiopuleri@mbp ~/Dropbox/Spring '17/CNT4007C/websocket/client
```

Server

Client

Results

All results are as expected from the specifications in `pa1.pdf`. The server program is able to accept a single websocket connection from one client at a time, perform addition subtraction and multiplication with 2-4 operands, respond with error codes if input is bad, close connection with a client and listen for another connection, and close connection and terminate itself. There are no abnormal results.

There are no bugs, missing items and limitations of the program
